

Curator

How to curate scientific data to tell scientific stories and make it easier for others to reuse them?

This method has been developed within ParCos. This project has received funding from the European Union's Horizon 2020 research and innovation program under grant agreement No. 872500.

About the Curator Cards

What?

The Curator Cards present a set of principles that support the visualisation of data for participatory science storytelling.

The Curator Cards can help decide which (aspects of a) dataset are relevant to provide evidence for a scientific story and which formats to choose to communicate to which audience.

For whom?

The cards can be used by anyone who wants to present data as part of science communication. It helps them to make the data easier to understand for people engaging with the story.

Why?

The data Curator Cards are intended to convey data to a general audience so that the experience is engaging, easy, and fun.

Why Data Curation?

The term curation finds its origin in museum practice. The various curation roles in a museum relate to two types of practices.

Just like the museum objects, data can also be collected, archived, preserved, interpreted and presented through stories.

Data curation principles

Based on the literature we identified these data curation principles:

Visualise data
as simply
as possible.

Curate the data in
a way that is as relevant
to the audience
as possible.

Use storytelling
to frame
the experiences
with the data.

Start with a small
part rather than
the whole data set.

Provide examples
and prompt ways
to expand upon
own interest.

Engage people
with data they didn't
collect and encourage
them to collect
their own data
and add to it.

Provide support
for how to ask good
questions from data.

Combine creative
with practical
activities.

The Curator Cards

The data Curator Cards are intended **to convey data to a general audience** so that the experience is engaging, easy, and fun.

The approaches are:

Make a comic strip about the dataset.

Build a chronological timeline out of a dataset.

Start with one core 'clue' piece of data and curate data around it.

Conduct a mini experiment by collecting and analyzing data.

Make a news article out of datasets, possibly as a 'reporter from the future'.

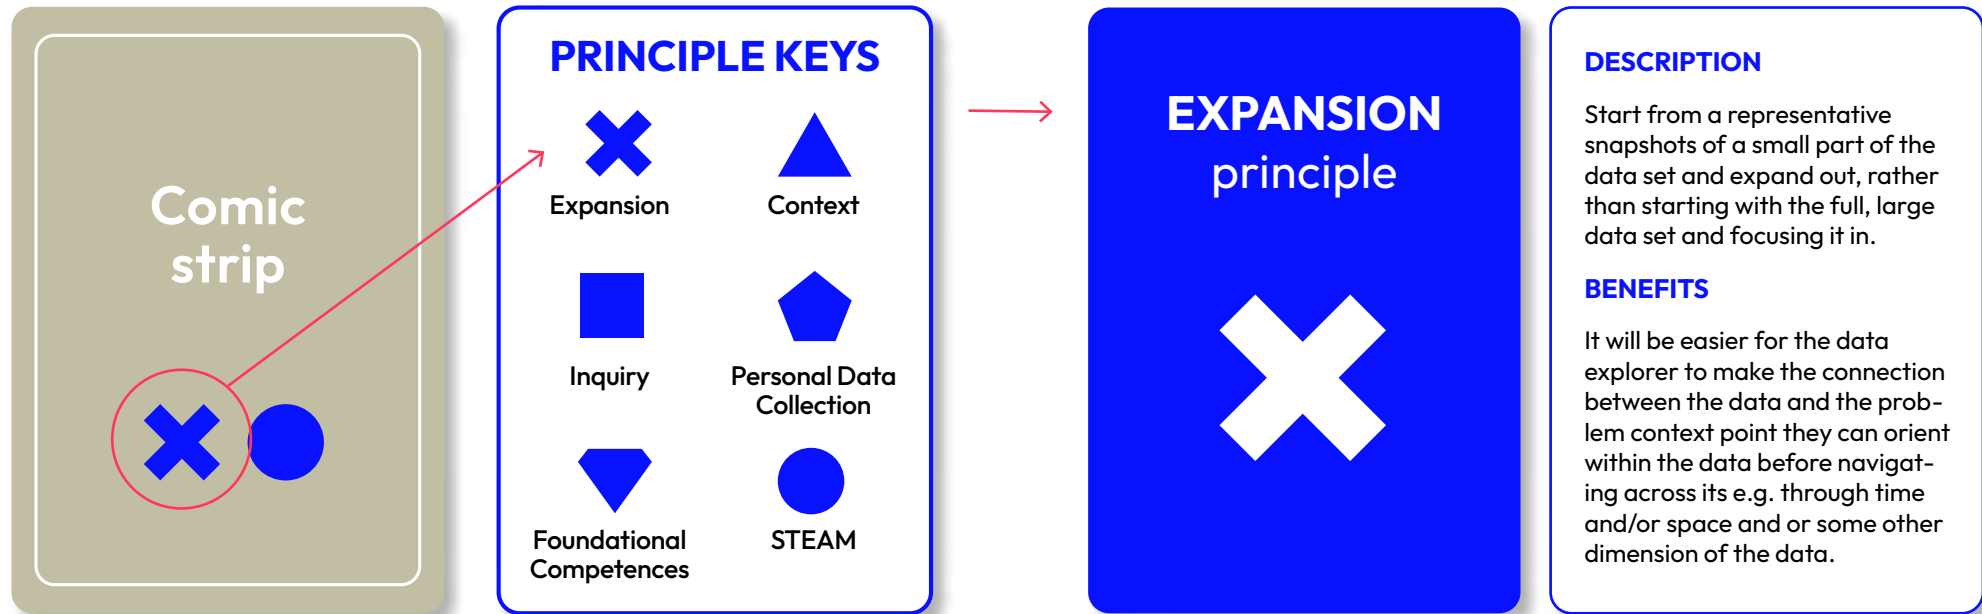

Have a Q&A with an 'expert' and invite audience questions.

How to Use the Curator Cards?

Each Curator Card also relates to certain principles:
